Something is different.

The question is, what?

Unless you know exactly *what* changed in your network, why, and who changed it—there's no telling how it will affect network availability.

One way to find out.

Request the Yankee Group's January, 2004 report on the importance of configuration management. And then attend a Tripwire webcast to learn how to apply the principles.

Tripwire makes the difference.

With Tripwire® for Network Devices however, you'll know exactly what is different, how it changed, and who changed it. Tripwire software monitors and reports changes on network devices including switches, routers, firewalls, and load balancers across the enterprise network.

● A difference in uptime. More.

Tripwire for Network Devices improves system availability in four ways.

- It immediately detects and reports changes to network devices, so that you have instant visibility into potential issues.
- It tells you exactly what changed, who initiated the change, and which systems are affected—dramatically reducing troubleshooting time and limiting exposure.
- Manual and automatic rollback features enable you to quickly return systems to a known and trusted state, minimizing downtime.
- It enables you to enforce change management policies so that fewer service-affecting changes occur in the first place.

● A difference in responsiveness. Faster.

Because Tripwire software continuously monitors systems for change, your staff doesn't have to. A single web-based console enables monitoring of thousands of devices. When an unexpected change occurs, comprehensive information is instantly sent to the right person. As a result, your staff is freed for more strategic initiatives.

● An accountability difference. Provable.

Regular baseline and conformance checks provide a running, auditable account of changes, making it faster and easier to comply with IT best practices, corporate policies, and regulatory requirements.
